## Basic Types & Variables

bool - Boolean

#### **Unsigned integers**

u8, u16, u32, u64, u128

#### Signed integers

i8, i16, i32, i64, i128

#### Floating point numbers

f32, f64

#### **Platform specific integers**

usize - Unsigned integer. Same number of bits as the platform's pointer type.

isize - Signed integer. Same number of bits as the platform's pointer type.

```
char - <u>Unicode scalar value</u>
&str - String slice
String - Owned string
```

#### **Tuple**

```
let coordinates = (82, 64);
let score = ("Team A", 12)
```

#### Array & Slice

```
// Arrays must have a known length and all
elements must be initialized
let array = [1, 2, 3, 4, 5];
let array2 = [0; 3]; // [0, 0, 0]

// Unlike arrays the length of a slice is
determined at runtime
let slice = &array[1 .. 3];
```

#### **HashMap**

```
use std::collections::HashMap;
let mut subs = HashMap::new();
subs.insert(String::from("LGR"), 100000);
// Insert key if it doesn't have a value
subs.entry("Golang Dojo".to_owned())
.or_insert(3);
```

#### Struct

```
// Definition
struct User {
    username: String,
    active: bool,
}

// Instantiation
let user1 = User {
    username: String::from("bogdan"),
    active: true,
};

// Tuple struct
struct Color(i32, i32, i32);
let black = Color(0, 0, 0);
```

#### **Enum**

```
// Definition
enum Command {
    Quit,
    Move { x: i32, y: i32 },
    Speak(String),
    ChangeBGColor(i32, i32, i32),
}

// Instantiation
let msg1 = Command::Quit;
let msg2 = Command::Move{ x: 1, y: 2 };
let msg3 = Command::Speak("Hi".to_owned());
let msg4 = Command::ChangeBGColor(0, 0, 0);
```

#### Constant

```
const MAX_POINTS: u32 = 100_000;
```

#### Static variable

```
// Unlike constants static variables are
// stored in a dedicated memory location
// and can be mutated.
static MAJOR_VERSION: u32 = 1;
static mut COUNTER: u32 = 0;
```

#### Mutability

```
let mut x = 5;
x = 6;
```

#### **Shadowing**

```
let x = 5;
let x = x * 2;
```

## Type alias

```
// `NanoSecond` is a new name for `u64`.
type NanoSecond = u64;
```

## **Control Flow**

#### if and if let

```
let num = Some(22);

if num.is_some() {
    println!("number is: {}", num.unwrap());
}

// match pattern and assign variable
if let Some(i) = num {
    println!("number is: {}", i);
}
```

#### loop

```
let mut count = 0;
loop {
  count += 1;
  if count == 5 {
    break; // Exit Loop
  }
}
```

#### **Nested loops & labels**

```
'outer: loop {
   'inner: loop {
      // This breaks the inner Loop
      break;
      // This breaks the outer Loop
      break 'outer;
   }
}
```

#### **Returning from loops**

```
let mut counter = 0;

let result = loop {
   counter += 1;

   if counter == 10 {
      break counter;
   }
};
```

#### while and while let

```
while n < 101 {
   n += 1;
}

let mut optional = Some(0);

while let Some(i) = optional {
   print!("{}", i);
}</pre>
```

#### for loop

```
for n in 1..101 {
   println!("{}", n);
}

let names = vec!["Bogdan", "Wallace"];

for name in names.iter() {
   println!("{}", name);
}
```

#### match

```
let optional = Some(0);

match optional {
    Some(i) => println!("{}", i),
    None => println!("No value.")
}
```

## References, Ownership, and Borrowing

#### Ownership rules

- Each value in Rust has a variable that's called its owner.
- 2. There can only be one owner at a time.
- 3. When the owner goes out of scope, the value will be dropped.

#### **Borrowing rules**

- 1. At any given time, you can have *either* one mutable reference *or* any number of immutable references.
- 2. References must always be valid.

#### **Creating references**

```
let s1 = String::from("hello world!");
let s1_ref = &s1; // immutable reference

let mut s2 = String::from("hello");
let s2_ref = &mut s2; // mutable reference

s2_ref.push_str(" world!");
```

#### Copy, Move, and Clone

```
// Simple values which implement the Copy
trait are copied by value
let x = 5;
let y = x;

println!("{}", x); // x is still valid

// The string is moved to s2 and s1 is
invalidated
let s1 = String::from("Let's Get Rusty!");
let s2 = s1; // Shallow copy a.k.a move

println!("{}", s1); // Error: s1 is invalid

let s1 = String::from("Let's Get Rusty!");
let s2 = s1.clone(); // Deep copy

// Valid because s1 isn't moved
println!("{}", s1);
```

#### Ownership and functions

```
fn main() {
  let x = 5;
  takes_copy(x); // x is copied by value
  let s = String::from("Let's Get Rusty!");
 // s is moved into the function
 takes_ownership(s);
 // return value is moved into s1
  let s1 = gives_ownership();
  let s2 = String::from("LGR");
  let s3 = takes_and_gives_back(s2);
}
fn takes_copy(some_integer: i32) {
  println!("{}", some_integer);
}
fn takes_ownership(some_string: String) {
  println!("{}", some_string);
} // some_string goes out of scope and drop
is called. The backing memory is freed.
fn gives_ownership() -> String {
  let some_string = String::from("LGR");
  some_string
}
fn takes_and_gives_back(some_string:
String) -> String {
  some_string
}
```

## **Pattern Matching**

#### **Basics**

```
let x = 5;

match x {
    // matching literals
    1 => println!("one"),
    // matching multiple patterns
    2 | 3 => println!("two or three"),
    // matching ranges
    4..=9 => println!("within range"),
    // matching named variables
    x => println!("{}", x),
    // default case (ignores value)
    _ => println!("default Case")
}
```

#### **Destructuring**

```
struct Point {
  x: i32,
 y: i32,
}
let p = Point { x: 0, y: 7 };
match p {
  Point \{ x, y: 0 \} => \{
    println!("{}" , x);
  },
  Point \{x, y\} \Rightarrow \{
    println!("{} {}" , x, y);
  },
}
enum Shape {
  Rectangle { width: i32, height: i32 },
  Circle(i32),
}
let shape = Shape::Circle(10);
match shape {
  Shape::Rectangle \{ x, y \} \Rightarrow //...
  Shape::Circle(radius) => //...
}
```

#### Ignoring values

```
struct SemVer(i32, i32, i32);

let version = SemVer(1, 32, 2);

match version {
    SemVer(major, _, _) => {
        println!("{}", major);
    }
}

let numbers = (2, 4, 8, 16, 32);

match numbers {
    (first, .., last) => {
        println!("{}}, {}", first, last);
    }
}
```

#### Match guards

```
let num = Some(4);

match num {
    Some(x) if x < 5 => println!("less than
five: {}", x),
    Some(x) => println!("{}", x),
    None => (),
}
```

#### @ bindings

```
struct User {
    id: i32
}

let user = User { id: 5 };

match user {
    User {
        id: id_variable @ 3..=7,
        } => println!("id: {}", id_variable),
    User { id: 10..=12 } => {
            println!("within range");
        },
        User { id } => println!("id: {}", id),
}
```

## **Iterators**

#### **Usage**

```
// Methods that consume iterators
let v1 = vec![1, 2, 3];
let v1_iter = v1.iter();
let total: i32 = v1_iter.sum();

// Methods that produce new iterators
let v1: Vec<i32> = vec![1, 2, 3];
let iter = v1.iter().map(|x| x + 1);

// Turning iterators into a collection
let v1: Vec<i32> = vec![1, 2, 3];
let v2: Vec<_> = v1.iter().map(|x| x + 1).collect();
```

### Implementing the Iterator trait

```
struct Counter {
  count: u32,
}
impl Counter {
  fn new() -> Counter {
    Counter { count: 0 }
  }
}
impl Iterator for Counter {
  type Item = u32;
  fn next(&mut self) -> Option<Self::Item>
  {
    if self.count < 5 {</pre>
      self.count += 1;
      Some(self.count)
    } else {
      None
    }
  }
}
```

## **Error Handling**

#### Throw unrecoverable error

```
panic!("Critical error! Exiting!");
```

#### **Option enum**

```
fn get_user_id(name: &str) -> Option<u32> {
  if database.user_exists(name) {
    return Some(database.get_id(name))
  }
  None
}
```

#### Result enum

```
fn get_user(id: u32) -> Result<User, Error>
{
   if is_logged_in_as(id) {
      return Ok(get_user_object(id))
   }
   Err(Error { msg: "not logged in" })
}
```

#### ? operator

```
fn get_salary(db: Database, id: i32) ->
Option<u32> {
    Some(db.get_user(id)?.get_job()?.salary)
}

fn connect(db: Database) ->
Result<Connection, Error> {
    let conn =
        db.get_active_instance()?.connect()?;
    Ok(conn)
}
```

#### Combinators

#### .map

```
let some_string = Some("LGR".to_owned());

let some_len = some_string.map(|s|
s.len());

struct Error { msg: String }
struct User { name: String }

let string_result: Result<String, Error> =
Ok("Bogdan".to_owned());

let user_result: Result<User, Error> =
    string_result.map(|name| {
        User { name }
        });
}
```

#### .and\_then

```
let vec = Some(vec![1, 2, 3]);
let first_element = vec.and_then(
    |vec| vec.into_iter().next()
);

let string_result: Result<&'static str, _>
= Ok("5");
let number_result =
    string_result
    .and_then(|s| s.parse::<u32>());
```

## Multiple error types

#### **Define custom error type**

```
type Result<T> = std::result::Result<T,
CustomError>;

#[derive(Debug, Clone)]
struct CustomError;

impl fmt::Display for CustomError {
   fn fmt(&self, f: &mut fmt::Formatter) ->
fmt::Result {
     write!(f, "custom error message")
   }
}
```

#### **Boxing errors**

```
use std::error;

type Result<T> = std::result::Result<T,
Box<dyn error::Error>>;
```

### Iterating over errors

## Ignore failed items with filter\_map()

```
let strings = vec!["LGR", "22", "7"];
let numbers: Vec<_> = strings
   .into_iter()
   .filter_map(|s| s.parse::<i32>().ok())
   .collect();
```

#### Fail the entire operation with collect()

```
let strings = vec!["LGR", "22", "7"];

let numbers: Result<Vec<_>, _> = strings
   .into_iter()
   .map(|s| s.parse::<i32>())
   .collect();
```

#### Collect all valid values and failures with partition()

```
let strings = vec!["LGR", "22", "7"];

let (numbers, errors): (Vec<_>, Vec<_>) = strings
    .into_iter()
    .map(|s| s.parse::<i32>())
    .partition(Result::is_ok);

let numbers: Vec<_> = numbers
    .into_iter()
    .map(Result::unwrap)
    .collect();

let errors: Vec<_> = errors
    .into_iter()
    .map(Result::unwrap_err)
    .collect();
```

## Generics, Traits, and Lifetimes

#### **Using generics**

```
struct Point<T, U> {
    x: T,
    y: U,
}

impl<T, U> Point<T, U> {
    fn mixup<V, W>(self, other: Point<V, W>)
-> Point<T, W> {
        Point {
            x: self.x,
            y: other.y,
        }
    }
}
```

## **Defining traits**

```
trait Animal {
  fn new(name: &'static str) -> Self;
 fn noise(&self) -> &'static str { "" }
}
struct Dog { name: &'static str }
impl Dog {
  fn fetch() { // ... }
}
impl Animal for Dog {
  fn new(name: &'static str) -> Dog {
    Dog { name: name }
  }
  fn noise(&self) -> &'static str {
    "woof!"
  }
}
```

## **Default implementations with Derive**

```
// A tuple struct that can be printed
#[derive(Debug)]
struct Inches(i32);
```

#### **Trait bounds**

```
fn largest<T: PartialOrd + Copy>(list:
&[T]) -> T {
  let mut largest = list[0];

for &item in list {
   if item > largest {
     largest = item;
   }
}

largest
}
```

#### impl trait

```
fn make_adder_function(y: i32) -> impl
Fn(i32) -> i32 {
  let closure = move |x: i32| { x + y };
  closure
}
```

#### **Trait objects**

```
pub struct Screen {
  pub components: Vec<Box<dyn Draw>>,
}
```

#### Operator overloading

```
use std::ops::Add;

#[derive(Debug, Copy, Clone, PartialEq)]
struct Point {
    x: i32,
    y: i32,
}

impl Add for Point {
    type Output = Point;

    fn add(self, other: Point) -> Point {
        Point {
            x: self.x + other.x,
            y: self.y + other.y,
        }
    }
}
```

#### **Supertraits**

```
use std::fmt;

trait Log: fmt::Display {
   fn log(&self) {
    let output = self.to_string();
    println!("Logging: {}", output);
   }
}
```

#### Lifetimes in function signatures

```
fn longest<'a>(x: &'a str, y: &'a str) ->
&'a str {
   if x.len() > y.len() {
        x
   } else {
        y
   }
}
```

#### Lifetimes in struct definitions

```
struct User<'a> {
  full_name: &'a str,
}
```

#### Static lifetimes

```
let s: &'static str = "Let's Get Rusty!";
```

## Functions, Function Pointers & Closures

#### Associated functions and methods

```
struct Point { x: i32, y: i32, }

impl Point {
    // Associated function
    fn new(x: i32, y: i32) -> Point {
        Point { x: x, y: y }
    }

    // Method
    fn getX(&self) -> i32 { self.x }
}
```

#### **Function pointers**

```
fn do_twice(f: fn(i32) -> i32, arg: i32) ->
i32 {
  f(arg) + f(arg)
}
```

#### **Creating closures**

```
let add_one = |num: u32| -> u32 {
  num + 1
};
```

#### **Returning closures**

```
fn add_one() -> impl Fn(i32) -> i32 {
    |x| x + 1
}

fn add_or_subtract(x: i32) -> Box<dyn
Fn(i32) -> i32> {
    if x > 10 {
        Box::new(move |y| y + x)
    } else {
        Box::new(move |y| y - x)
    }
}
```

#### Closure traits

- **FnOnce** consumes the variables it captures from its enclosing scope.
- FnMut mutably borrows values from its enclosing scope.
- **Fn** immutably borrows values from its enclosing scope.

#### Store closure in struct

```
struct Cacher<T>
where
   T: Fn(u32) -> u32,
{
   calculation: T,
   value: Option<u32>,
}
```

#### Function that accepts closure or function pointer

```
fn do_twice<T>(f: T, x: i32) -> i32
  where T: Fn(i32) -> i32
{
  f(x) + f(x)
}
```

#### **Pointers**

#### References

```
let mut num = 5;
let r1 = # // immutable reference
let r2 = &mut num; // mutable reference
```

#### Raw pointers

```
let mut num = 5;
// immutable raw pointer
let r1 = &num as *const i32;
// mutable raw pointer
let r2 = &mut num as *mut i32;
```

## Smart pointers

**Box<T>** - for allocating values on the heap

```
let b = Box::new(5);
```

Rc<T> - multiple ownership with reference counting

```
let a = Rc::new(5);
let b = Rc::clone(&a);
```

Ref<T>, RefMut<T>, and RefCell<T> - enforce borrowing rules at runtime instead of compile time.

```
let num = 5;
let r1 = RefCell::new(5);
// Ref - immutable borrow
let r2 = r1.borrow();
// RefMut - mutable borrow
let r3 = r1.borrow_mut();
// RefMut - second mutable borrow
let r4 = r1.borrow_mut();
```

#### Multiple owners of mutable data

```
let x = Rc::new(RefCell::new(5));
```

## Packages, Crates, and Modules

#### **Definitions**

- Packages A Cargo feature that lets you build, test, and share crates.
- Crates A tree of modules that produces a library or executable.
- Modules and use Let you control the organization, scope, and privacy of paths.
- **Paths** A way of naming an item, such as a struct, function, or module.

## Creating a new package with a binary crate

```
$ cargo new my-project
```

#### Creating a new package with a library crate

```
$ cargo new my-project --lib
```

#### **Defining and using modules**

```
fn some_function() {}
mod outer module { // private module
  pub mod inner_module { // public module
    pub fn inner_public_function() {
      super::super::some_function();
    }
   fn inner_private_function() {}
  }
}
fn main() {
  // absolute path
  crate::outer_module::
  inner_module::inner_public_function();
 // relative path path
  outer_module::
  inner_module::inner_public_function();
 // bringing path into scope
  use outer_module::inner_module;
  inner module::inner public function();
}
```

## Renaming with as keyword

```
use std::fmt::Result;
use std::io::Result as IoResult;
```

## Re-exporting with pub use

```
mod outer_module {
    pub mod inner_module {
        pub fn inner_public_function() {}
    }
}
pub use crate::outer_module::inner_module;
```

## Defining modules in separate files

```
// src/lib.rs
mod my_module;

pub fn some_function() {
   my_module::my_function();
}

// src/my_module.rs
pub fn my_function() {}
```
